                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         à
                                                                                                                                                        The invention comprises the amino acid and coding sequences of human NOVOX (NOV1 and NOV2) proteins. The NOVOX proteins of the invention are useful for identifying an agent (a cellular receptor or downstream effector) that binds to a NOVOX protein. The NOVOX DNA and protein sequences of the invention are useful for the treatment (gene therapy) or prevention (vaccine) of: cancer; neurodegenrative disorders; immune disorders; hasmatopoietic disorders; von Hippel-Lindau (VHL) syndrome; Alzheimer's disease; stroke; tuberous sclerosis; hypercalcaemia; hzheimer's disease; stroke; tuberous sclerosis; hypercalcaemia; larkinson's disease; Huntington's disease; cerebral palsy; epilepsy; Lesch-Nyhan syndrome; ataxia-tellangiectasia; pain; depression; stress and diabetes. The present DNA sequence represents a NOVI gene PCR primer
                                                                                                                                                                                                                                                                                                                                                                                           ö

                                                                                                                                                                                                                                                                                                                                  The invention comprises the amino acid and coding sequences of human NOVOX (NOV1 and NOV2) proteins. The NOVOX proteins of the invention are useful for identifying an agent (a cellular receptor or downstream effector) that binds to a NOVOX protein. The NOVOX DNA and protein sequences of the invention are useful for the treatment (gene therapy) opervention (vaccine) of: cancer; neurodegenerative disorders; immune disorders; haematopoietic disorders; neurodegenerative disorders; immune syndrome X; wasting disorders; von Hippel-Lindau (VHL) syndrome; Alzheimer's disease; stroke; tuberous sclerosis; hypercalcaemia; Parkinson's disease; Huntington's disease; cerebral palsy; epilepsy; lesch-Myhan syndrome; attaxia-telangiectasia; pain; depression; stress andiabetes. The present DNA sequence represents a NOVI gene PCR primer
Novel cytoplasmic, nuclear, membrane bound and secreted NOVX polypeptides, useful for treating cancers, neurodegenerative disorders, immune disorders, hematopoietic disorders, diabetes and metabolic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

The invention comprises the amino acid and coding sequences of human NOVOX (NOV1 and NOV2) proteins. The NOVOX proteins of the invention are useful for identifying an agent (a cellular receptor or downstream effector) that binds to a NOVOX protein. The NOVOX DNA and protein sequences of the invention are useful for the treatment (gene therapy) or prevention (vaccine) of: cancer; neurodegenerative disorders; immune disorders; hammacopoietic disorders; Von Hippel-Lindau (VHL) syndrome; Alzheimer's disease; stroke; tuberous sclerosis; hypercalcaemia; Parkinson's disease; Huntington's disease; cerebral palsy; epilepsy; Lesch-Nyhan syndrome; ataxia-telangiacitasia; paln; depression; stress and diabetes. The present DNA sequence represents a NOV2 gene PCR primer
                                                                                                                                                                                                                                                                                                                                                                                                                                                        ..

The invention describes an isolated NOVX polypeptide (I) comprising a sequence selected from a sequence (S1) of 1121, 635, 299, 1720, 176, 583, C2 214, 395, 1098, 134, 477, 133, 407, 806, 804, 1253, 399, 1320, 135, 240, 1069, 116, 499, 1138, 477, 316, 269, 219, 205, 406, 460, 365, 380, 829 or 326 amino acids fully defined in the specification, and the mature form of S1. (I) is useful for treating or preventing a pathology associated with (I) in a subject, preferably thuman, or for identifying an agent that binds to (I), where the agent is compared to a cellular receptor or a downstream effector. (I), a polymorleotide (II) encoding (I) or an anti-(I)-antibody (V) is useful treating or preventing disorders or syndromes such as autoimmune disease, allergies, Alzheimer's concording (I) or an anti-(I)-antibody (V) is useful treating or preventing disorders or syndromes such as autoimmune disease, allergies, Alzheimer's colleases, stroke, parkinson's disease, Huntington's disease, multiple sclerosis, addiction, anxiety, pain, diabetes, glomentlonephritis, systemic lupus erythematosus, asthma, scleroderma, graft versus host disease, pancreatitis, obesity, ulcers, anaemia, cancer, trauma, viral, colsease, pancreatitis, obesity, ulcers, anaemia, cancer, trauma, viral, disease, (I), (II) or (V) is useful in screening assays, correption assays completing (e.g., diagnostic assays, prognostic assays, monitoring clinical trails and pharmacogenomic), and in methods of treatment (e.g., diagnostic assays, prognostic assays, prognostic assays, to express
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ·.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ic and prophylactic). (II) is useful in gene therapy, to express letect NOVX mRNA or a genetic lesion in a NOVX gene, and to NOVX activity. This sequence represents a primer used to isolate
                                                                                                                                                                                                                                                                                                                                                                                                               Novel isolated NOVX polypeptide useful treating or preventing disorders or syndromes such as autoimmune disease, allergies, Alzheimer's disease, stroke, Parkinson's disease, Huntington's disease or multiple sclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; NOVX; PCR; ss; metabolic disorder; cardiomyopathy; diabetes; ASD;

New isolated NOVX polypeptide useful for treating atherosclerosis, metabolic disorders, diabetes, obesity, infectious disease, anorexia, neurodegenerative disorders, Alzheimer's disease and cancer.

Example 83; Page 368; 666pp; English.

The invention relates to human polypeptides, termed NOVX, and the

ö polynucleotides encoding them. The polypeptides and polynucleotides are useful for diagnosing disease, and screening for potential therapeutic agents. The sequences are useful for treating metabolic disorders, cardiomyopathy, diabetes, hypertension, congenital heart defects, arterious, attrains septal defect (ASD), attrioventricular canal defect, ductus arterious, pulmonary stenosis, subaoritic stenosis, ventricular septal defect (VSD), valve diseases, tuberous sclerosis, scleroderma, atherosclerosis, obesity, infectious disease, anoraxia, neurodegenerative disorders, Alzheimer's disease, parkinson's disease, immune disorders, haemacopoietic disorders, haemophilia, hypercoagulation, Crohn's disease, and cancer. This sequence represents a PCR primer used to amplify a human New histone deacetylase 9 polypeptide, useful for screening for candidate compounds that share a, bind to, or inhibits the histone deacetylase 9 biological activity, and for diagnosing or prognosing cancer, e.g. deacetylase (HDAC) activity. Polypeptides and nucleic acids of the invention are useful for screening for candidate compounds that share, bind to, or inhibit histone deacetylase 9 (HDAC9) biological activity, and for diagnosing or prognosing cancer, e.g. leukaemia such as TEL-AML1 postitive and negative pre-B cell acute lymphoblastic leukemia or B cell lymphoma. The current sequence the human HDAC9 exon 4 alternative 5' splice donor consensus sequence Gaps Human HDAC9 exon 4 alternative 5' splice donor consensus sequence. The present invention describes an isolated nucleic acid molecule (I) comprising a nuclectide sequence of Drosophila melanogaster, human or mouse microRNAs (miRNAs), or their precursors, a complement of it, a nuclectide sequence that has an affinity of at least 80 % to them or a nuclectide sequence that has an affinity of at least 80 % to them or a nuclectide sequence that hybridises under stringent conditions to them Also described: (1) a pharmaceutical composition containing the nucleic acid and, optionally, a carrier; and (2) identifying miRNA molecules or precursor molecules, comprising ligating 5'- and 3'-adapter molecules to the ends of a size-fractionated RNA population, reverse transcribing the adapter-containing RNA population and characterising the reverse transcribing the gene therapy. The pharmaceutical composition is useful for diagnostic and therapeutic applications, and as a marker or a modulator of developmental
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New nucleic acid molecule for diagnostic and therapeutic applications and as a marker or a modulator of developmental or pathogenic processes, e.g. cancer, comprises microRNAs of a Drosophila melanogaster, a human or a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               or pathogenic processes, particularly of cancer (e.g. B-cell chronic leukaemia) or gene expression. The miRNA molecules may also be used in tissue reprogramming procedures. The present sequence represents an miRNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Drosophila melanogaster; human; mouse; microRNA; miRNA; cytostatic; gene therapy; diagnostic; therapeutic; developmental modulator; pathogenic modulator; cancer; B-cell chronic leukaemia;

agent (a cellular receptor of downstream ellector) that blinds to Nova.

Nova and Nova nucleic are useful for treating or preventing Nova associated disorders in humans, and in the manufacture of a medicament for treating a Nova related disease human disease e.g.

darenoleukodystrophy, congenital adrenal hyperplasia, haemophilia, hypercoagulation, idiopathic thrombocytopaenic purpura, autoimmune disease, allergies, immunodeficiencies, transplantation, Von Hippelliniand (VHL) syndrome, Alzheimer's disease, cerebral palsy, epilepsy, parkinson's disease, Huntington's disease, cerebral palsy, epilepsy, lesch-Nyhan syndrome, multiple sclerosis, ataxia-telangicctasia, leukodystrophies, behavioural disorders, addiction, anxiety, pain, neuroprotection, diabetes, renal artery stenosis, interstitial nephritis, glomerulonephritis, polycystic kidney disease, systemic lupus erypercalcaemia, cirrhosis, transplantation, asthma, emphysema, celeroderma, adult respiratory distress syndrome (ANDS), graft versus host disease (GYND), lymphedema, fertility, pancreatitis, obesity, host disease (GYND), lymphedema, fertility, pancreatitis, obesity, bacterial or parasitic infections. The present sequence is a real-time quantitative (RYO)-PCR primer used to determine the tissue specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                      NOV27 polypeptides, a mature form of NOVX, a variant of NOVX or a fragment of NOVX Also included are determining the presence or amount of NOVX in a sample (by using an antibody that immunospecifically bind to the polypeptide), determining the presence of or predisposition to disease associated with altered levels of NOVX in a first mammalian subject, identifying a potential therapeutic agent for use in the treatment of pathology related to abstrant expression of physiological interactions of NOVX, screening for a modulator of activity or of latency or predisposition to a pathology associated with NOVX, the nucleic acid encoding NOVX, vectors and host cells. NOVX is useful for identifying an agent (a cellular receptor or downstream effector) that binds to NOVX.
                                                                                                                                                                                                                                                                                                                                                                         invention relates to an isolated NOVX polypeptide selected from NOV1-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          sickle cell anaemia; beta-thalassaemia; alpha-thalassaemia;

The invention relates to a novel method for detecting a specific acid polymer, where a second nucleotide residue replaces the first nucleotide residue, where a second nucleotide residue replaces the first nucleotide residue, comprising extending the detection primer using a polymerising agent in a mixture containing one or more nucleoside triphosphates (WTPB) and detecting the incorporation of the WTP. The method of the invention may be useful for identifying specific point mutations and genetic variations, such as those associated with sickle cell anaemia, beta and alpha-thalassaemia, phenylketonuria, haemophilia, alphal-anti trypsin deficiency and cystic fibrosis. Specifically, the method on disease, for the detection of somatic mutations in cancer, for the selection of cells and strains for industrial biotechnology and for plant and animal breeding. The method comprises few and easily performed procedures, thus is especially suited for routine determinations of point mutations and nucleotide variations and allows the quantification of the proportion of mutated cells in a sample as well as the identification. The current sequence is that of the PCR primer Pl of the invention which was used to amplify human apolipoprotein E (ApoE) DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; ss, PCR; NOVX; endozepine-like protein; metabolic disorder; diabetes; obesity; infectious disease; anorexia; cancer; cardiovascular disease, hypertension; atherosclerosis; neurodegenerative disorder; Alzheimer's disease; Parkinson's disease; epilepsy; immune disorder; alzheimer's disease; Parkinson's disease; epilepsy; immune disorder; asthema; dyslipidaemia; neurogenesis; cell differentiation; cell proliferation; haematopoiesis; wound healing; angiogenesis; gene therapy; primer; RTQ-PCR; real time quantitative PCR.
                                                                                                                                                                                                                                                                                     Detecting a specific nucleotide variation at a defined site in a target nucleic acid polymer, useful for pre- or postnatal diagnosis of diseases, comprises extending the detection primer using labeled nucleotide

The invention relates to an isolated NOVX polypeptide comprising 3 NOV1

Drotein variants (NOVIa, NOVIc and NOVId) and NOV2 (appearing as

ADD7218, ADD72120 and ADD7223, all being endozepine—like proteins); a

CC mature form of NOVX; or a seguence that is at least 95% identical to, or

having one or more conservative amino acid substitutions in, the NOVX

CC mature form of NOVX; or a seguence that is at least 95% identical to, or

having one or more conservative amino acid substitutions in, the NOVX

CC methods for determining the presence of or predisposition to a disease

associated with altered levels of expression of NOVX or NOVX nucleic acid

molecule in a first mammalian subject, a method of identifying an agent

cc that binds to NOVX, a method for identifying a potential therapeutic

dent binds to NOVX, a method for identifying a pathology

condition of activity or of latenty or predisposition to a pathology

CC methods for treating or preventing a pathology associated with NOVX, a

method for treating or preventing a pathology associated with NOVX, a

cc and molecule encoding NOVX (including their variants), a vector

CC comprising the nucleic acid molecule, a cell comprising the vector, an

CC antibody that binds immunospecifically to NOVX and a method for preventing

CC antibody that binds immunospecifically to NOVX and an enthod for preventing

CC antibody that binds immunospecifically to NOVX and an enthod for preventing NOVX. The polypeptides, nucleic acid molecules and antibodies are useful in the manufacture of a medicament for treating a syndrome associated with a human disease, preferably a NOVX-associated disorder. The nucleic acid molecules, polypeptides and antibodies are useful for treating, preventing or diagnosing diseases such metabolic disorders, diabetes, obesity, infectious diseases (viral, bacterial, fungal, helminthic, and

protozoal), anorexia, cancer, cardiovascular diseases (hypertension, atherosclerosis), neurodegenerative disorders, Alzheimer's disease, pilepsy, immune disorders (osteoarthritis), haematopoietic disorders, inflammatory skin disorders, asthma, and various dyslipidaemias. The nucleic acids and polypeptides may also be used as targets for the identification of small molecules that modulate or inhibit e.g. neurogenesis, cell differentiation, cell proliferation, haematopoiesis, wound healing and angiogenesis, in gene therapy, in generation of antibodies that bind immunospecifically to NOVX substances for use in therapoutic or diagnostic methods. The nucleic acids are

comparison expression or interactions or predisposition to a pathology associated with NoVX, a method for modulating the activity of NoVX, a method for preventing a pathology associated with NoVX, a method for preventing a pathology associated with NoVX, a method for treating a pathology state in a mammal, an isolated nucleic acid molecule acid molecule encoding NoVX (including their variants), a vector and the nucleic acid molecule, a cell comprising the vector, and antibody that binds immunospecifically to NoVX and antibodies are useful in the manufacture of a medicament for treating a syndrome associated with a human disease, preferably a NoVX-associated disorder. The nucleic acid molecules polypeptides and antibodies are useful for treating, preventing or diagnosing diseases such metabolic disorders, diabetes, obesity, infectious diseases (viral, bacterial, fungal, helminthic, and protozoal), anorexia, cancer, cardiovascular diseases (hypertension, atherosclerosis), neurodegeneative disorders, Alzheimer's disease, barkinson's disease, epilepsy, immune disorders, asthma, and various dysligidaemias. The nucleic acids and polypeptides may also be used as targets for the identification of small molecules that modulate or inhibite e; an neurogenesis, cell differentiation, cell proliferation, chaematopoiesis, wound healing and angiogenesis, in gene therapy, in certain and angiogenesis, in gene therapy, in comparation of antibodies that bind immunospecifically to NoVX substances further used as thybrid and proposed in thromogenesis, and polypeptides are the proposed as that bind immunospecifically to its resurges in the respect or inhibite and and proposed and publication and proposed as the proposed and that bind immunospecifically to its resurges in the respect or inhibite and and proposed in the resurber in the result of the result 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          0
                                                 mature form of NOVX; or a sequence that is at least 95% identical to, or having one or more conservative amino acid substitutions in, the NOVX proteins. Also included are a composition comprising NOVX and a carrier, methods for determining the presence of or predisposition to a disease associated with altered levels of expression of NOVX or NOVX nucleic acid molecule in a first mammalian subject, a method of identifying an agent that binds to NOVX, a method for identifying a potential therapeutic agent for use in the treatment of a pathology which is related to abstrant expression or interactions of NOVX, a method for screening for a
ADD72118, ADD72120 and ADD72123, all being endozepine-like proteins); a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; ss; PCR; NOVX; endozepine-like protein; metabolic disorder; diabetes; obesity; infectious disease; anorexia; cancer; cardiovascular disease; hypertension; atherosclerosis; neurodegenerative disorder; Alzheimer's disease; Parkinson's disease; epilepsy; immune disorder; osteoarthritis; haematopoietic disorder; chinflammatory skin disorder; asthma; dysilpidaemia; neurogenesis; cell differentiation; cell proliferation; haematopoiesis; wound healing; angiogenesis; gene therapy; primer; RTQ-PCR; real time quantitative PCR.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                further used as hybridisation probes, in chromosome mapping, tissue typing, preventive medicine, and pharmacogenomics. The present sequence represents an RTQ (real time quantitative) PCR primer used to assay
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ;

detecting in a patient a predisposition to a genetic disorder resulting from a specific nucleotide variation at a defined site in a genetic material of the patient by employing the steps of the method above, a kit for determining the specific nucleotide variations in a target nucleic acid polymer, a reagent for detecting the presence of a point mutation in which a normal nucleic acid residue is replaced by an abnormal nucleic

acid residue at a defined site within gene of interest, detecting at a defined site in the genome of a microorganism the existence of point

mutations leading to altered pathogenicity or resistance to therapy in microorganisms and detecting cells having a point mutation at a defined site in the genetic material. The method is useful for identifying specific point mutations and genetic variations. Specifically, the method can be used for pre- or postnatal diagnosis of hereditary predispositions or diseases, for the detection of somatic mutations in cancer, for the selection of cells and strains for industrial biotechnology and for plant

and animal breeding. The new method provides several advantages over prior methods. The new method comprises few and easily performed

RESULT 699

The invention relates to an isolated NoVX polypeptide comprising 3 NOV1 protein variants (NOV12, NOV12 and NOV13 and NOV2 (appearing as ADD72118, ADD72123, all being endozepine-like proteins); a mature form of NOVX, or a sequence that is at least 95% identical to, or with a composition comprising NOVX and carrier, proteins. Also included are a composition comprising NOVX and carrier, methods for determining the presence of or predisposition to a disease composition of NOVX or NOVX nucleic activation of NOVX or NOVX nucleic activation of the treatment of a pathology which is related to aberrant expression or interactions of NOVX, a method for identifying an agent of aberrant expression or interactions of NOVX, a method for screening for agent for use in the treatment of a pathology which is related to aberrant expression or interactions of NOVX, a method for modulating the activity of NOVX, and associated with NOVX, a method for modulating the activity of NOVX, and associated with NOVX, a method for modulating the activity of NOVX.

The polypeptides of treating or preventing a pathology associated with NOVX, a method for modulating the administry of NOVX. The polypeptides, nucleic acid molecules and antibodies are useful or antibody that binds immunospecifically to NOVX and a method for producing the nucleic acid molecules and antibodies are useful or in the manufacture of a medicament for treating a syndrome associated with a human disease, preferrably a NOVX-associated disorder. The nucleic acid molecules, inflammatory skin disorders, disbetes, obseity, infectious diseases (viral, bacterial, fungal, helminthic, and acid molecules for the identification of send polypeptides may also be attricted of antibodies are useful ferentiation, and accorder of sharmanic or said and polypeptides may a sociated and polypeptides may a stagets for the identification of small molecules that modulate or inhibit engo nervation of antibodies; wound healing and anglogenesis, in gene therapers or inhibite or inhering or a stargets used as hybridisation probes, in chromosome mapping, tissue preventive medicine, and pharmacogenomics. The present sequence New isolated NOVX polypeptides and polynuclectides, useful for preventing, diagnosing or treating NOVX-associated disorders, e.g. osteoarthritis, obesity, atherosclerosis, cancer, Parkinson's disease, for use in therapeutic or diagnostic methods. The nucleic acids are further used as hybridisation probes, in chromosome mapping, tissue represents an RTQ (real time quantitative) PCR primer used to assay tissue/cell specific expression of NOVX. Example 4; SEQ ID NO 33; 89pp; English. 29-NOV-2001; 2001US-00997594. 25-JAN-2001; 2001US-0264180P. 20-AUG-2001; 2001US-0313656P. 2000US-0253834P.

```
The invention relates to detecting a specific nucleotide variation at a defined site in a target nucleic acid polymer, where a second nucleotide residue. Comprises hybridising a detectable amount of a target nucleotide residue. Comprises hybridising a detectable amount of a target nucleotide residue. Supplementary to the nucleotide several nucleotide residues and is complementary to the nucleotide sequence of interest in a region disposed toward the 3' end from the sequence of interest in a region disposed toward the 3' end from the care no nucleotide residues between the defined site and the 3' end of the primer that are identical to the first or second nucleotide residues to be detected), extending the primer using a polymerising agent in a mixture containing one or more NTPs (and at least one NTP complementary to either the first or second nucleotide residue that comprises a means for detecting the incorporation of the NTP; and catic polymer and optionally one or more chain terminating NTPs) and detecting the incorporation of the NTP, where the identity of the nucleotide residue at the defined site is determined, also included are nucleotide residue at the defined site is determined.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Detecting a specific nucleotide variation at a defined site in a target nucleic acid polymer, useful for pre- or postnatal diagnosis of diseases, comprises extending the detection primer using labeled nucleotide

ö
procedures, thus especially suited for routine determinations of point mutations and mucleotide variations, allows the quantification of the proportion of mutated cells in a sample as well as the identification of mutations present in as little as 0.5% of the analysed cell population, and is easily automated. The present sequence is a PCR primer used in the method of the invention to detect polymorphisms in the apolipoprotein gene corresponding to amino acids 112 and 158.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        cardiovascular; antiarteriosclerotic; hypotensive; cytostatic; anorectic; antidiabetic; immunosuppressive; anti-HIV; neuroprotective; nootropic; antiparkinsonian; antiasthmatic; antiinfertility; cardiomyopathy; atherosclerosis; hypertension; cancer; obseity; diabetes; AIDS; multiple sclerosis; graft-versue-host disease; Alzheimer's disease; Parkinson's disease; asthma; fertility disorder; chromosome mapping; tissue typing; preventive medicine; pharmacogenomic; vaccine; primer; ss.

α

New NOVX polypeptides and nucleic acid molecules useful for preventing or treating NOVX-associated disorders, e.g. cancer, cardiomyopathy, atherosclerosis or diabetes, in chromosome mapping, tissue typing or in pharmacogenomics.

Disclosure; SEQ ID NO 1440; 1503pp; English.

The invention relates to 566 new isolated human polypeptides and their encoding genes, sequences that are at least 95% identical to these or sequences comprising one or more conservative substitutions in these. The polypeptide, polymucleotide and antibodies against the polypeptides are useful in diagnosing, treating or preventing NOVX-associated disorders, e.g. cardiomyopathy, atherosclerosis, hypertension, cancer, obesity, diabetes, ALDS, multiple sclerosis, graft-versus-host disease, Darkinson's disease, asthma, or fertility disorders. The nucleic acids are further used as hybridization probes, in chromosome mapping, tissue typing, preventive medicine, and pharmacogenomics. The polypeptides are also useful as vaccines. This sequence represents an example of the forward primer used to amplify a probe to isolate the nucleic acid sequences of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to a immunogenic polypeptide fragment comprising ten to fifty consecutive amino acids of a fully defined detrusor estrogen-regulated protein (DERP). The invention is useful for diagnossing DERP-related disorder such as impaired detrusor contractility, urinary retention, Alzheimer's disease, cardiovascular disease, usinary retention, Alzheimer's disease, cardiovascular disease, osteoporosis, or their combinations. The invention is also useful for generating antibodies, as reagents in diagnostic assays, as identifiers of other gene products involved in the regulation of bladder and smooth muscle function, as screening reagents useful for detecting compounds that are used in the regulation of bladder and smooth muscle function, and as pharmaceutical agents useful for treating symptoms relating to bladder and smooth muscle function. The present sequence is rat DERP DNA
                                                                                                                                                                                                                                                                                                                                                                                                            Detrusor estrogen-regulated protein; DERP; DERP-related disorder; impaired detrusor contractility; urinary retention; Alzheimer's disease; cardiovascular disease; osteoporosis; smooth muscle function; nootropic; neuroprotective; osteopathic; immunostimulant; therapy; rat; RT-PCR;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel purified immunogenic detrusor estrogen-regulated polypeptide fragment useful for generating antibodies and as screening reagents

The present invention relates to a polynucleotide isolated from a human gene and is useful for detecting a single nucleotide polymorphism in a human gene or for diagnosing of disease. The invention enables the detection of a single nucleotide polymorphism in a human gene. The present sequence represents a primer of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                     DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      G-protein coupled receptor for asthma susceptibility, AAA1, asthma associated alternatively spliced gene 1, primer, PCR; chronic obstructive pulmonary disease; cancer; rhinitis; dermatitis; cytostatic, antiasthmatic, transgenic, asthma locus-1.
                                                                                                                                                                                                                                                                                                                                                                                                                 Novel polynucleotide useful for PCR amplification along with two fragment from another set of sequences, or for detecting single

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     activities. Furthermore, it provides a transgenic animal comprising the asthma locus-1 (AST-1) DNA. This oligonucleotide sequence is a PCR primer
                                                                                                                                                                                                                                                     This invention relates to the identification of a novel susceptibility locus AST-1 for asthma and other IgE mediated diseases mapped to the human chromosome 7p14-p15. Specifically, it refers to two overlapping genes namely GPRA (G-protein coupled receptor for asthma susceptibility) and AAA1 (asthma associated alternatively spliced gene 1). The present invention describes identifying single nucleotide polymorphisms, as well as insertion or deletion polymorphisms, occurring at different positions in the AST-1 locus, and furthermore providing vectors, host cells, primers and probes in order to determine the status of an individual. Accordingly, it provides a kit to diagnose or assess predisposition to asthma, chronic obstructive ullmonary disease or cancer and other IgE mediated diseases including rhinitis and dermatitis, such that derived
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Detecting aberrant promoter methylation associated with a predisposition to cancers of the breast, lung and colon in a human, useful for diagnosing or monitoring cancer, comprises detecting methylation of the
                                                                                                                                        New GPRA polypeptides, useful in preparing a composition for diagnosing, treating or preventing asthma, other IgE-mediated disease, chronic obstructive pulmonary disease or cancer.

                                               The invention relates to a novel method for detecting aberrant promoter methylation associated with predisposition to cancers of the breast, lung and colon in a human comprising detecting methylation of the PAK5 alpha or beta gene. The method of the invention may be useful in screening for, monitoring or diagnosing human cancer, particularly breast, lung or colon cancer. The current sequence is that of the stage 2 MSP (methylation specific PCR) primer beta-BSM3 of the invention used to analyse the human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New antibodies specific for membrane bound IgA - and hybridomas producing them, used to increase IgA prodn., partic. in patients with infectious disease or allergy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The primer is used in a polymerase chain reaction amplification of DNA segments from a human lung fibroblast line (W138) phages library containing alpha-1 or alpha-2 gene segments of the human 1gA membrane-anchoring extracellular peptide. This segment is used to induce the formation of monoclonal antibodies which modulate (increase) 1gA synthesis. The IgA can be used in the treatment of patients subject to infectious diseases or suffering from allergy. (Updated on 25-WAR-2003)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The primers AAT10550-1 were used to amplify the genomic inserts from phages contg. sequences encoding the alpha-1 and alpha-2 isoforms of the membrane anchoring peptide from a human 13h. This primer is based on sequence located in the intron, about 1 kb downstream from the constant heavy chain region 3 exon. The phages were isolated from a human lung fibroblast line library in the phage FIX, using the probe AAT10549. The sequences encoding the extracellular portion of the membrane anchoring peptide (AAR8191) can be used to raise antibodies against the 1gA membrane extracellular peptide which can modulate 1gA synthesis, esp. to increase their prodn. The peptides and antibodies can be used to treat or in the prophylaxis of infectious diseases, allergies and immunodeficiency diseases. (Updated on 25-MAR-2003 to correct PF field.)

The present sequence invention describes ribozymes targeted to modulate the synthesis and/or expression of interleukin (IL)-2R gamma encoded RNA. AAV93889 to AAV94574 represent specifically claimed ribozymes, and AAV94575 to AAV95260 represent specifically claimed substrate sequences from the present invention. The ribozymes can be used for the treatment of, e.g. graft rejection, autoimmune disease, cancer, psoriasis, allergy and other inflammatory conditions. The ribozymes are also used to induce tolerance in a recipient to alloantigen from a donor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Ribozymes targetted to interleukin 2 - useful for treating e.g. cancer, autoimmune disease and allergies.
                                                                                                                                                                                                    Human, IL-2 receptor g-chain; interleukin 2 receptor gamma chain;

                                                                                                                                                                                                                                                                                                                                                                                                                                            (BLAT/)
(MCSW/)
 purified DNA of positive clones identified by the probe AAT86542. An oligonuclectide probe (AAT86542) which corresponds to a segment located in the CH3 coding region of immunoglobulin allotype alphal and alpha2 and was synthesised and used as a probe to screen phage clones containing oil or alpha2 gene segments. The library was constructed using genomic DNA from human lung fibroblast line, W138, packaged in phage FIX. Primer AAT86543 is located in the intron about lkb downstream from CH3 exon and primer AAT86544 is a very conservative segment in the mouse alpha membrane exon. The invention relates to a unique extracellular peptide segments form, entirely or in part, antigenic epitopes unique to membrane bound but not secreted IgA, and thereby provide a unique to membrane bound but not secreted IgA, and thereby provide a unique epitope on the IgA-bearing B cells to which membrane bound IgA is attached. These peptide segments can be used as immunogens to generate antibodies which specifically, target membrane-bound IgA and IgA-bearing B cells. (Updated
                                                                                                                                                                                                                                                                                                                                                                                                                                                        Peptide fragments of human membrane-bound immunoglobulin A - for generating anti-IgA antibodies, useful for treatment of B-cell leukaemia(s) or lymphoma(s) or IgA-mediated nephropathy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              0.8%; Score 14.4; DB 1; Length 17; 93.8%; Pred. The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down cegulates expression of a neurite growth inhibitor gene (NGOD). The regulates expression of a neurite growth inhibitor gene (NGOD). The concleic acids (e.g. a ribozyme or a nucleic acids may be enzymatic nucleic acid cleaving a an RNA molecule CD possessing an NCH mocif, a G-cleaver (cleaving RNA with a NCW nucleif) provided in the presence of a divalent cation that is preferably MG<sup>2</sup> +.

Concloin the presence of a divalent cation that is preferably MG<sup>2</sup> +.

Cruthermore, it may be contacted with a cell to reduce CD20 activity of the cell and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more conforced. The conforced with a cell to reduce CD20 activity of the cell and treatment may further comprise the use of one or more conforced. In particular, the CD20 targetting nucleic acid may be used to treat lymphoma (MLL), bulky low-grade or follicular NHL, lymphocytic lymphoma (MCL), immunocytopana (IMC) small B-cell lymphocytic lymphoma, conforced acid is used to cleave RNA of the NOGO gene in the presence of a divalent cation that is preferably MG<sup>2</sup>+. Furthermore, the presence of a divalent cation that is preferably MG<sup>2</sup>+. Furthermore, the concleic acid may be contacted with a cell to reduce NOGO activity of the concleic acid may be concacted with a cell to reduce NOGO activity of the concleic. In and treat a patient having a condition associated with the level of therapies. In particular, the NOGO-targetting nucleic acid may be contacted with a cell to reduce Concerted with a cell to reduce CO therapies. In particular, the NOGO-targetting nucleic acid may be concacted with a cell to reduce NOGO activity of the contacted with a cell to reduce NOGO activity of the concacted with a cell to reduce not more cell and treat a patient having a condition associated with a cell sea to concition acid and any be use
                                                                                                                             Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and central nervous system injury.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Claim 30; Page 152; 200pp; English.

In particular, these sequences are directed at the following genes: adenosine deaminase, p53, beta-globin, retinoblastoma, BRCAI, BRCAI, CFTR, cyclin-dependent kinase inhibitor 2A (CDKNAA), APC, Factor V, Factor VII, Factor IX, haemoglobin alpha locus apolipoprotein E (APOE), LDL receptor (LDLN), UDP-glucuronosyltransferase (UGTI), amyloid precursor protein (APC), presentiin-1 (PSENI) and presentiin-2 (PSENI). These can be used in the gene therapy of diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention provides single-stranded oligonucleotides which can

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention provides single-stranded oligonucleotides which can be used for the targeted alteration of genomic sequences, where the oligonucleotide has at least one mismatch compared with the genomic sequence to be altered. In particular, these sequences are directed at the following genes: adenosine deaminase, p53, beta-globin, retinoblastoma, BRCA1, BRCA2, CFTR, cyclin-dependent kinase inhibitor 2A (CDKV2A), APC, Factor VIII, Factor IX, haemoglobin alpha locus 1 (HBA2), haemoglobin alpha locus 2 (HBA2), MLH1, MSH2, MSH6, apolipoprotein E (APOE), LDL receptor (LDLR), uDP-glucuronosyltransferase (UGT1), amyloid precursor protein (APC), presentlin-1 (PSEN1) and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; gene therapy, adenosine deaminase deficiency; p53; beta-globin, retinoblastoma; BRCA1; BRCA2; CFTR; cystic fibrosis; cancer; Factor V; cyclin-dependent kinase inhibitor 2A; CDKN2A; melanoma; APC; HBA1; HBA2; adenomatous polyposis of the colon; Factor VII; Factor IX; thrombosis; haemophilia; alpha thalassaemia; haemoglobin alpha locus 1; MLH1; APOE; mismacch repair; MSH2; MSH6; hyperlipidaemia; apolipoprotein E; LDLR; familial hypercholesterolaemia; QGTI; syndrome; APP; PSENI; antisense; UDP-glucuronosyltransferase; amyloid precursor protein; presentilin-1; Alzheimer's disease; cytostatic; antisickling; antianaemic; haemostatic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Oligonucleotide for targeted alterations of genetic sequences and for treating cystic fibrosis, comprises at least one mismatch and chemical modification.
              haemophilia, hypercholesterolaemia, thalassaemia, sickle cell anaemia, Alzheimer's disease, melanoma, adenomatous polyposis of the colon and various syndromes. The present sequence is one of the gene correcting

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to canine beta-galactosidase. The cDNA molecule and kit are useful for screening the R60H mutation of acid betagalactosidase. The cDNA molecule is also useful for screening Portuguese Water dogs to eliminate carriers of GM-gangliosidosis from breeding
presentiin-2 (PSEN2). These can be used in the gene therapy of diseases such as cancer, adenosine deaminase deficiency, cystic fibrosis, haemophilia, hypercholesterolaemia, thalassaemia, sickle cell anaemia, Alzheimer's disease, melanoma, adenomatous polyposis of the colon and various syndromes. The present sequence is one of the gene correcting oligonucleotides of the invention

The present invention provides nucleotides encoding molecular variants of the human multi drug resistance-1 (MDR-1) protein. These can be used to identify compounds capable of treating multidrug resistance and sensitivity interfering resulting from polymorphisms in MDR-1, which can lead to difficulties in treating cancer, cardiovascular, neuronal, inflammatory and CNS diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; gene therapy; tumour suppressor; HTPL; chromosome 10p12.1; human testis expressed Patched like protein; testis; adrenal; liver; male germ cell development; bone marrow; brain; kidney; lung; placenta; prostate; skeletal muscle; colon; male infertility; cancer; ss.

The present invention relates to human testis expressed Patched like protein (HTPL, see ABV78759 to ABV78762 and ABB98519 to ABB98520). HTPL has two isoforms, with a few single base pair differences between the two. One of the single base pair changes introduces a premature stop codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL shares an overall structure organisation with the Patched protein. The shares an overall structure organisation with the Patched protein. The shared structural features strongly imply that HTPL plays a role similar to that of Patched, and is a potential tumour suppressor. HTPL is important in regulating male germ cell development, and the HTPL gene was mapped to human chromosome lopi2.1. HTPL and ist coding sequence are useful for diagnosing a disorder caused by mutation in HTPL, and in therapy and manufacture of a medicament for treatment or prevention of such disorder associated with decreased expression or activity of human HTPL. Such disorders include disorders of testis, or adrenal, adult and foctal liver, bone marrow, brain, kidney, lung, placenta, prostate, skeletal muscle or colon function. HTPL proteins and nucleic agents for male infertility and cancer. The present oligonucleotide was used in an example from the invention 0; Human; gene therapy; tumour suppressor; HTPL; chromosome 10p12.1; human testis expressed Parched like protain; testis; adrenal; liver; male germ cell development; bome marrow; brain; kidney; lung; placenta; prostate; skeletal muscle; colon; male infertility; cancer; ss. The invention relates to a nucleic acid molecule (I) which down regulates expression of an Ets-related gene (ERG). (I) is useful for treating conditions selected from cancer, lymphoma, Bwing's sarcoma, melanoma, conditions selected from cancer, lymphoma, Ewing's sarcoma, melanoma, cumour angiogenesis, diabetic retinopathy, macular degeneration, cumour angiogenesis, diabetic retinopathy, macular degeneration, verruca vulgaris, angiofibroma of tuberous sclerosis, port-wine stains, Sturge Weber syndrome, Rippel-Trenaunay-Weber syndrome, Osler-Weber-rendu cyndrome, leukaemia, osteoprosis and wound healing. (I) is useful for treating a patient having a condition associated with the level of ERG, by contacting cells of the patient with (I) under conditions suitable for the treatment. Leukaemia or tumour conjunction with one or more of other therapies such as radiation or chemotherapy treatment. (I) is useful for reducing ERG activity in a conjunction with one or more of other therapies such as radiation or chemotherapy treatment. (I) is useful for reducing ERG activity in a coll, by contacting (I) is useful for reducing ERG activity in a cell, by contacting (I) is useful for diagnosis of conditions and diseases related to the expression of ERG, and as diagnostic tool to the presence of ERG RNA in a cell. (I) is useful for specifically the presence of ERG RNA in a cell. (I) is useful for specifically carryeting genes that share homology with ERG gene or ERG fusion genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel polynucleotide which down regulates expression of Ets-related gene, useful for treating cancer, diabetic retinopathy, macular degeneration, arthritis, psoriasis, verruca vulgaris and Sturge Weber syndrome.
               neovascular glaucoma; myopic degeneration; arthritis; verruca vulgaris; angiofibroma of tuberous sclerosis; port-wine stain; wound healing; Sturge Weber syndrome; Kippel-Trenaunay-Weber syndrome; leukaemia; ss; Osler-Weber-rendu syndrome, leukaemia; osteoporosis; DNAzyme; inozyme;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              nucleic acid molecules which regulate expression of ERG, and

gene, Novel polynucleotide which down regulates expression of Ets-related genuseful for treating cancer, diabetic retinopathy, macular degeneration, arthritis, psoriasis, verruca vulgaris and Sturge Weber syndrome.

WPI; 2002-082995/11.

Claim 4; Page 61; 149pp; English.

The invention relates to a nucleic acid molecule (I) which down regulates expression of an Ets-related gene (ERG). (I) is useful for treating conditions selected from cancer, lymphoma, Ewing's sarcoma, melanoma, tumour angiogenesis, diabetic retinopathy, macular degeneration, tumour angiogenesis, diabetic retinopathy, macular degeneration, convascular glaucoma, myopic degeneration, arthritis, psoriasis, verruca vulgaris, angiofibroma of tuberous sclerosis, port-whose stains, Sturge Weber syndrome, Rippel-Trenaunay-Weber syndrome, Osler-Weber-rendu Syndrome, leukaemia, osteoporosis and wound healing. (I) is useful for treating a patient having a condition associated with the level of ERG, by contacting cells of the patient with (I) under conditions suitable for the treatment. Leukaemia or tumour angiogenesis is treated by administering (I) to the patient in conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or chemotherapy treatment. (I) is useful for reducing ERG activity in a cell, by contacting the cell with (I). (I) is useful for cleaving RNA of ERG gene, by contacting (I) with RNA, in the presence of a divalent cation such as Mg2+. (I) is useful for diagnosis of conditions and diseases related to the expression of ERG, and as diagnostic tool to examine genetic drift and mutations within diseased cells or to detect the presence of ERG RNA in a cell. (I) is useful for specifically targeting genes that share homology within diseased cells or to detect the presence of ERG RNA in a cell. (I) is useful for specifically engagenesic mucleic acids, including antisense and enzymeatro nucleic acids, including antisense and related PCR primers of the invention

```
The invention relates to a nucleic acid molecule (I) which down regulates expression of an Ets-related gene (ERG). (I) is useful for treating conditions selected from cancer, lymphoma, Ewing's sacroma, melanoma, conditions selected from cancer, lymphoma, Ewing's sacroma, melanoma, tumour angiogenesis, diabetic retinopathy, macular degeneration, cumour angiogenesis, diabetic retinopathy, macular degeneration, or unigaris, angiofibroma of tuberous sclerosis, port-wine stains, Sturge Weber syndrome, leukaemia, osteoporosis and wound healing. (I) is useful for treating a patient having a condition associated with the level of ERG, by contacting cells of the patient with (I) under conditions suitable for the treatment. The method comprises the use of one or more theraples the treatment in method comprises the use of one or more theraples conditions suitable for the treatment. Leukaemia or tumour conjunction with one or more of other theraples such as radiation or conjunction with one or more of other theraples such as radiation or conjunction with one or more of other theraples such as radiation or conjunction with one or more of other theraples such as radiation or conjunction with one or more of other theraples such as radiation or conjunction with one or more of other theraples such as radiation or conjunction with one or more of other theraples such as radiation or conjunction with one or more of other theraples such as radiation or call, by contacting (I) is useful for diagnostic of conditions and ciseases related to the expression of ERG, and as diagnostic tool to examine genetic drift and mutations within regulate expression of ERG and carged parts and mutations within regulate expression of ERG, and carged proverser nucleic acid molecules within regulate expression of ERG, and carged proverser nucleic acid molecules within regulate expression of ERG, and carged proverser nucleic acid molecules within regulate expression of ERG, and created proversers of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      gene,

neovascular glaucoma, myopic degeneration, arthritis, psoriasis, verruca vulgaris, angiofibroma of tubercous sclerosis, port-wine stains, Sturge Weber syndrome, Kippel-Trenaunay-Weber syndrome, Osler-Weber-rendu volugaris, angiofibroma of tubercous sclerosis, port-wine stains, Sturge Weber syndrome, leukaemia, osteoporosis and wound healing. (I) is useful for treating a patient having a condition associated with the level of ERG, by contacting cells of the patient with (I) under conditions suitable for the treatment. Leukaemia or tumour the treatment. The method comprises the use of one or more therapies under conditions suitable for the treatment. Leukaemia or tumour angiogenesis is treated by administering (I) to the patient in conjunction with one or more of other therapies such as radiation or chemotherapy treatment. (I) is useful for reducing ERG activity in a cell, by contacting the cell with (I). (I) is useful for cleaving RNA of ERG gene, by contacting (I) with RNA, in the presence of a divalent cation such as Mg2+. (I) is useful for diagnosis of conditions and diseases related to the expression of ERG, and as diagnostic tool to examine genetic drift and mutations within diseased cells or to detect the presence of ERG RNA in a cell. (I) is useful for specifically the presence of ERG RNA in a cell. (I) is useful for specifically the presence of ERG RNA in a cell. (I) is useful for specifically capering genes that share homology with ERG gene or ERG fusion genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a nucleic acid molecule (I) which down regulates expression of an Ets-related gene (ERG). (I) is useful for treating conditions selected from cancer, lymphoma, Ewing's sarcoma, melanoma, tumour angiogenesis, diabetic retinopathy, macular degeneration,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This invention describes a novel isolated nucleic acid that encodes one of three new isoforms of human pregnancy associated plasma protein E, harapper. The products of the invention have aborrive and contraceptive activity and can be used for gene therapy or in a vaccine. The nucleic acid, polypeptide encoded by it, or antibody to the polypeptide can be used in pharmaccutical compositions or vaccines for preventing or aborting pregnancy. PAPP-E is used in the antenatal diagnosis of dyspenetic pregnancies. The nucleic acids are used as probes to assess the level of PAPP-E isoform mRNA in chorionic villus samples, and the antibodies can be used to assess the expression levels of PAPP-E isoform proteins in chorionic villus samples, to diagnose dysgenetic pregnancies antenatally. This sequence represents an oligomer used in scanning the human PAPP-E genes described in the disclosure of the invention
ABKI7354-ABK22719 represent nucleic acids, including antisense and enzymatic nucleic acid molecules which regulate expression of ERG, and related PCR primers of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    PAPP-E; human; pregnancy associated plasma protein B; abortive; contraceptive; gene therapy; vaccine; pregnancy; antenatal; diagnosis; dysgenetic pregnancy; primer; ss.

This invention describes a novel isolated nucleic acid that encodes one of three new isoforms of human pregnancy associated plasma protein E, PABPP-E. The products of the invention have abortive and contraceptive activity and can be used for gene therapy or in a vaccine. The nucleic acid, polypeptide encoded by it, or antibody to the polypeptide can be used in pharmaceutical compositions or vaccines for preventing or aborting pregnancy. PABPP-E is used in the antenatal diagnosis of dysgenetic pregnancies. The nucleic acids are used as probes to assess the level of PAPP-E isoform mRNA in chorionic villus samples, and the antibodies can be used to assess the expression levels of PAPP-E isoform proteins in chorionic villus samples, to diagnose dysgenetic pregnancies antenatally. This sequence reperseents an oligomer used in scanning the human PAPP-E genes described in the disclosure of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

The invention relates to enzymatic nucleic acid molecules that down regulate expression of chloride channel calcium activated 1 (CLCA1) genes by cleaving RNA derived from the genes. The nucleic acid sequences are useful as pharmaceutical agents for treating conditions such as chronic obstructive pulmonary disease (COPD), chronic bronchitis, asthma, cystic fibrosis, obstructive bowel syndrome and any other diseases or conditions that are related to or will respond to the levels of CLCA1 in a cell or tissue. The sequences are useful for reducing CLCA1 activity in a cell, hence, are useful for treatment of a patient having a condition cascolated with the level of CLCA1, where the invention further comprises the use of one or more therapies under conditions suitable for the treatment, for example, oxygen therapy, bronchodilators, corticosteroids, antibacterials, vaccinations, acetylcysteine and mucokinetic agents. The cample acids of the invention are also used as diagnostic tools to examine genetic drift and mutations within diseased cells or to detect the presence of CLCA1 and a cell. This sequence represents an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 17 BP; 5 A; 4 C; 4 G; 0 T; 4 U; 0 Other;

Human CLCAl gene enzymatic nucleic acid #1995.

(first entry)

ABK57624;

```
The invention relates to enzymatic nucleic acid molecules that down regulate expression of chloride channel calcium activated 1 (CLCA1) genes by cleaving RNA derived from the genes. The nucleic acid sequences are useful as pharmaceutical agents for treating conditions such as chronic obstructive pulmonary disease (COPD), chronic bronchitis, asthma, cystic fibrosis, obstructive bowel syndrome and any other diseases or conditions that are related to or will respond to the levels of CLCA1 in a cell or tissue. The sequences are useful for reducing CLCA1 activity in a cell, consequences are useful for reducing CLCA1 activity in a cell, associated with the level of CLCA1, where the invention further comprises the use of one or more therapies under conditions suitable for the treatment, for example, broadhodilators, corticosteroids, antibacterials, vaccinations, acetylcyteine and mucokinetic agents. The nucleic acids of the invention are also used as diagnostic tools to examine genetic drift and mutations within diseased cells or to detect the presence of CLCA1 RNA in a cell. This sequence represents an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

The invention relates to enzymatic nucleic acid molecules that down regulate expression of chloride channel calcium activated 1 (CLCA1) genes by cleaving RNA derived from the genes. The nucleic acid sequences are useful as pharmaceutical agents for treating conditions such as chronic obstructive pulmonary disease (OPDD), chronic bronchitis, asthma, cystic fibrosis, obstructive bowel syndrome and any other diseases or conditions contributed to or will respond to the levels of CLCA1 in a cell or tissue. The sequences are useful for reducing CLCA1 activity in a cell, chence, are useful for treatment of a patient having a condition contributed with the level of CLCA1, where the invention further comprises the use of one or more therapies under conditions suitable for the treatment, for example, oxygen therapy, bronchodilators, corticosteroids, antibacterials, vaccinations, acetylcysteine and mucokinetic agents. The uncleic acids of the invention are also used as diagnostic tools to examine genetic drift and mutations within diseased cells or to detect the presence of CLCA1 RNA in a cell. This sequence represents an
                                                                                                                                                                                                                                                                                                                                                                                                                                 Enzymatic polynucleotide that down regulates expression of chloride channel calcium activated gene, useful for treating Chronic obstructive pulmonary disease (COPD), chronic bronchitis and asthma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   WNV, West Nile Virus; antiinflammatory; cytostatic; hepatotropic; virucide; neuroprotective; antibacterial; repplication; panoreatitis; encephalitis; myocarditis; meningitis; infection; hepatitis; encephalitis; cancer; cirrhosis; Hammerhead; Inozyme; DNAzyme;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to enzymatic nucleic acid molecules that down regulate expression of chloride channel calcium activated 1 (CLCA1) genes by cleaving RNA derived from the genes. The nucleic acid sequences are useful as pharmaceutical agents for treating conditions such as chronic obstructive pulmonary disease (COPD), chronic bronchitis, asthma, cystic fibrosis, obstructive bowel syndrome and any other diseases or conditions that are related to or will respond to the levels of CLCA1 in a cell or tissue. The sequences are useful for reducing CLCA1 activity in a cell, hence, are useful for treatment of a patient having a condition associated with the level of CLCA1, where the invention further comprises the use of one or more therapies under conditions suitable for the treatment, for example, oxygen therapy, bronchodilators, corticosteroids, antibacterials, vaccinations, acetylcysteine and mucokinetic agents. The nucleic acids of the invention are also used as diagnostic tools to examine genetic drift and mutations within diseased cells or to detect the presence of CLCA1 RNA in a cell. This sequence represents an

The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, mycoarditis, meningitis, neurologic infection, hepatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DMAzyme, Maberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least ten 2'-O-methyl modifications, phosphorothioate linkages on at least three of the 5' terminal nuclectides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid
                                                                                                                                                                                                                         New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               WNV; West Nile Virus; antiinflammatory; cytostatic; hepatotropic; virucide; neuroprotective; antibacterial; replication; pancreatitis; encephalitis; myocarditis; meningitis; infection; hepatitis; liver failure; cancer; cirrhosis; Hammerhead; Inozyme; DNAzyme;

of the West Nile Virus (WAV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, encephalitis, myocarditis, meningits, neurologic infection, hepatitis, molecule is meleciplated to WNV infection e.g. pancreatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of mucleic acid molecules further comprise at least five ribose residues, at least three of the 5' terminal nucleotides and a 3' end modification of a 3'-3' inverted abasic molety. Nucleic acid molecules SEQ ID No 194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid
                                                                                                                                                                                                   The invention relates to nucleic acid molecules that modulate replication
                                                                                                 New nucleic acid molecule that modulates replication of West Nile Virus
                                                                                                                 (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

New nucleic acid molecule that modulates replication of West Nile Virus

ö

```
ö
                                                                                               The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, encating a condition related to why infection e.g. pancreatitis, encaphalitis, mayorarditis, menningitis, neurologic infection, hepatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least three of the S' terminal nucleotides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (WNV). The nucleic acid molecules are useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            WNV, West Nile Virus; antiinflammatory; cytostatic; hepatotropic; virucide; neuroprotective; antibacterial; replication; panoreatitis; encephalitis; myocarditis; meningitis; infection; hepatitis; encephalitis; and ancer; cirrhosis; Hammerhead; Inozyme; DNAzyme;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
(WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.

The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (MNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, encephalitis, myocarditis, meningitis, neurologic infection, hepatitis, niver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least ten 2'-O-methyl modifications, phosphorothioate linkages on at
                                                                                                                                                                                                                                                                                                                                                ö
encephalitis, myocarditis, maningitis, neurologic infection, hepatitis, liver failure, hepatocallular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNRzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least ten 2'-O-methyl modifications, phosphorothioate linkages on at least three of the 5' terminal nucleotides and a 3' end modification of a 3' ai inverted abasic moiety. Nucleic acid molecules SED ID NO 1 to 37080 are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid

The inventorial relates to a mover instance of the inventorial sequence.

Given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence with, after optimal alignment, at least 80 % identify to the 17 mer sequence, a sequence that their invention of them, or the corresponding RNA. The novel isolated nucleic of any of them, or the corresponding RNA. The novel isolated nucleic caids of the invention are useful as probes and primers for detecting, identifying and/or amplifying a nucleic acid, e.g. as one component of a gene chip, in vitro as (anti)sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, polypeptides, vectors containing the nucleic acids, cells containing the vector or antibodies directed against the polypeptides are useful for the preparation of pharmaceuticals for prevention and/or treatment of viral caseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and contained the expression of the 17 mer nucleic acids in containent samples is useful for diagnosis and/or prognosis of these contained the polypeptides can also be used to generate antibodies, and both the polypeptide and antibodies are useful as components of protein
least three of the 5' terminal nucleotides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid molecule of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Cytostatic, virucide, neuroprotective; nootropic; neuroleptic, gene chip, antisense, sense; tumour; cell degeneration; cancer; Alzheimer's disease; schizophrenia; protein chip; gene therapy; tumour suppression; human fukutin; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a novel isolated 17 mer nucleic acid sequence,
                                                                                                                                                                                                                 Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ59889 - ABZ62216, ABZ64544 - ABZ65531, ABZ66520 - ABZ66524, ABZ65530 - ABZ65536 represent substrate/target sequences for the human
chips. The nucleic acid sequences of the invention can be used in gene therapy. This polynucleotide sequence represents a tumour suppression related human fukutin oligonucleotide of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rhematic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV acid molecules are useful for reducing also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ59889 - ABZ62216, ABZ64544 - ABZ65531, ABZ66520 - ABZ65224,

The invention relates to a novel collection of cultured cells, comprising at least 5 genotypically distinct cells, where each of the at least 5 genotypically distinct cells is coisogenic with respect to the others of the at least 5 genotypically distinct cells at a target locus common among them, and where each of the at least 5 genotypically distinct cells can be separately assayed. The collection of cells is useful for identifying genotypes of a target locus that alter a cellular phenotype. The collection is also useful for pharmacogenomic studies, and in studies of structure-activity relationships of existing, and of potential new, therapeutic agents permitting multiplex analysis of the effects of amino acid changes on ligand-receptor interactions. The sequences shown in ACC733714 represent human ACC73275-ACC74126 represent human CYP2D6 targeting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel cultured cell collection comprising at least 5 genotypically distinct cells each of which is coisogenic with respect to other cells at target locus common among them, useful for identifying target locus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; cultured cell; coisogenic; genotypically distinct; target locus;
ABCB1 (MDR1); targeting oligonucleotide; CYP2D6; ss.

The invention comprises nucleic acids (e.g. antisense oligonucleotides)
that down regulate the expression or inhibit the function of a receptor
for an eurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR),
IKappaB kinase (ITKK), or protein kinase PKR. The nucleic acids of the
invention are useful for treating: cerebrovascular accident, central
nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma,
lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis,
restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune
disease, lupus, multiple sclerosis, transplant/graft rejection,
ischaemia/reperfusion injury, glomerulomephritis, sepsis, and allergic
conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The
nucleic acids of the invention are also useful for down-regulating the
cypression of a target gene and as a diagnostic tool to examine genetic
drifts and mutations within diseased calls or to detect the presence of a
target RNA in a cell. The present RNA sequence represents a human IKK-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel enzymatic nucleic acid that down-regulates expression of neurite growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase or protein kinase PKR genes, for treating cancer and inflammatory disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Claim 59; SEQ ID NO 1473; 317pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a novel collection of cultured cells, comprising at least 5 genotypically distinct cells, where each of the at least 5 genotypically distinct cells is coisogenic with respect to the others of the at least 5 genotypically distinct cells at a target locus common among them, and where each of the at least 5 genotypically distinct cells can be separately assayed. The collection of cells is useful for identifying genotypes of a target locus that alter a cellular phenotype. The collection is also useful for pharmacogenomic studies, and in studies of structure-activity relationships of existing, and of potential new, therapoutic agents permitting multiplex analysis of the effects of amino and incompressions in the collection is also well in the collection in the collection is also useful for pharmacogenomic studies of the collection is also well in the collection in the collection is also well the collection in the collection is also well in the collection in the collection is also well than a collection in the collection is also well than a collection in the collection is also well than a collection in the collection is also well than a collection in the collection is also well than a collection in the collection is also well than a collection in the collection is also well than a collection in the collection is a collection in the collection in the collection is a collection in the collection in the collection in the collection is a collection in the collection 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel cultured cell collection comprising at least 5 genotypically distinct cells each of which is coisogenic with respect to other cells at target locus common among them, useful for identifying target locus

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            sclerosis and Alzheiner's disease. Hypersensitivity diseases include Type I hypersensitivities such as contact with allergens that lead to allergies. Type II hypersensitivities such as those present in doodpasture's syndrome and Type IV hypersensitivities such as those manifested in leprosy. Infectious diseases include viral infections caused by viruses such as HIV, fungal infections such as those caused by schistosomes, filaria and bacterial infections such as those caused by Mycobacterium. Neoplastic diseases include lymphoproliferative diseases
                                                                                                                                                                                                                                                         autoimmune, degenerative nervous system and infectious disease, comprises nucleic acid primers specifically priming and allowing amplification of a Vbeta gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        graft versus host disease, hypersensitivity diseases, infectious diseases and neoplastic diseases. Autoimmune diseases include Addison's disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              atrophic gastritis. Degenerative nervous system diseases include multiple
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  such as leukaemias, lymphomas and cancers such as cancer of the brain, breast. The present sequence represents a Vbeta gene repeat sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Biotinylated-oligonucleotide, genetic fingerprinting, hybridisation, molecular biology; forensic medicine, criminology; ss.
                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a kit for diagnosing and treating T-cell associated diseases which comprises a panel of nucleic acid primers specifically priming and allowing amplification of each Vbeta gene, VbetaRNA or CDNA. The kit is useful gradiagnosing organ transplant rejection and diagnosing and treating T-cell associated diseases including autoimmune diseases, degenerative nervous system diseases.
                                                                                                                                                                                                                                        Kit for diagnozing and treating T-cell associated diseases e.g.

A method has been developed of defining a set of compounds that modulate the expression of a target nucleic acid (tNA) sequence via binding of the compounds with the tNA sequence. The method comprises generating a library of virtual compounds in silico according to defined criteria, and according to defined criteria. Also described are: (1) a method of defining a set of Oligonucleotides (ONS) that modulate the expression of a tNA sequence via binding of the ONS with the tNA sequence via binding of the ONS with the tNA sequence comprising generating a library of virtual compounds in silico according to defined criteria, and evaluating in silico the binding of the virtual ONS with the tNA according to defined criteria; and (2) a method of defining a set of compounds that modulate the expression of a tNA sequence via binding of the compounds with the tNA. The methods can be used for the generation
provide compounds having defined physical, chemical or bioactive properties, e.g. antisense activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     and identification of synthetic compounds having defined physical, chemical or bioactive properties. Information gathered from assays of such compounds is used to identify nucleic acid sequences that are tractable to a variety of nucleotide sequence-based technologies, e.g. antisense drug discovery and target validation. AAZ40852 to AAZ41220, and AAY52701 to AAY52706, represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 18 BP; 3 A; 6 C; 4 G; 5 T; 0 U; 0 Other;

(ISIS-) ISIS PHARM INC.

WPI; 1999-561046/47.

AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ7744 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other treatment.

N.B. The SEQ ID NOS 2852, 2913, 2974, 3035, 3096, 3157, 3227, 3297 and

Claim 8; Page 1311; 2745pp; English.

Antisense compounds complementary to Cellular Inhibitor of Apoptosis-2 useful for e.g. diagnostics, therapeutics, and as research reagents.

Claim 3; Col 39; 33pp; English

```
ö
        The invention provides antisense compounds of 8-30 nucleotides that inhibit the expression of human Cellular Inhibitor of Apoptosis-2 (c-IAP-2). The antisense compounds may be used for diagnostrie, therapeutics (for modulating the expression of c-IAP-2), prophylaxis (e.g. to prevent or delay infection, inflammation, or tumor formation), as research and in kits. Sequences AA22210-142 represent phosphorothicate oligonucleotides used for antisense inhibition of cellular inhibitor of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel biallelic markers used to construct a high density disequilibrium

The present invention relates to an antisense compound of up to 30 mucleobases in length, which specifically hybridises with and inhibits the expression of human steroid receptor coactivator-1 (SRC-1) (also known as F-SRC-1 and NGOA-1) gene. The antisense compounds are useful for diagnostics, therapeutics, prophylaxis, or as research reagents or kits. The antisense oligomolectides are useful for treating an animal, particularly a human, suspected of having or being prone to a disease or condition associated with the expression of SRC-1. In particular, the antisense oligomolectides are useful for preventing delaying or treating infection, inflammation or tumour formation. The present sequence is an antisense oligomucleotide, ISIS# 29895, targetted to human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to a method of toxicological diagnosis, involving taking a DNA-containing sample from an organism or cell culture that has been treated with a test compound and determining any changes in the DNA methylation status or pattern caused by said test compound. The method is used for diagnosis and prognosis of adverse toxic responses in individuals. The present sequence is a PCR primer used to demonstrate the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Toxicological diagnosis, useful for diagnosis and prognosis of adverse reactions, based on effect of test compounds on methylation status of selected genes, involves determining changes in DNA methylation status.
                           New antisense oligonucleotides for inhibiting the expression of human steroid receptor coactivator-1, particularly useful for preventing, delaying or treating infection, inflammation or tumor formation.
                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human gene methylation status determination method PCR primer #123.
                                                                                                                                                                                                                                                                                                                                                        ö

The invention relates to a nucleic acid comprising a sequence (I) of at least 18 bases in length of a segment of chemically pre-treated genomic CO least 18 bases in length of a sequences of (ABX3399-ABX3402) or its complement. Also included are an oligonuclectide or peptide nucleic acid (or set thereof) of at least 9 nuclectides which hybridises to (I), probes for detecting cytosine methylation or singlenuclectide polymorphisms (SNP) in (I), an array of oligomers or peptide nucleic acids for analysing diseases associated with the methylation cancer and properties and of experience of the CpG dinuclectides of (I). The array is useful for determining genetic and/or epigenetic parameters, classification, differentiation, grading, staging, treatment and/or diagnosis of astrocytomas, or the predisposition to astrocytomas by analysing cytosine completions, involves obtaining a biological sample containing genomic DNA, extracting the genomic DNA, converting cytosine bases which are unmethylated at the 5-position, in the genomic DNA sample, to uracil or behaviour, by chemical treatment and amplifying chemically pre-treated concerns of the array and a polymerase, where the concerns of a detectable label. The method further involves concentificates carry a detectable label. The method further involves concentificates carry a detectable label. The method further involves concentifying methylation status of one or more cytosine positions, and analysing methylation status of the cytosine positions by using a concern more data sets. The genomic DNA is chemically treated by using a

complifies DNA which is of particular interest in astrocytoma or brain citisme, based on the specific genomic methylation status of brain citisme, based on the specific genomic methylation status of brain citismes, as opposed to background DNA. The amplificates carry a fluorescent label or radionuclide. Optionally, the labels of the amplificates are detected in a mass spectrometer. The fragments of chemically contracted genomic DNA to be amplified, have a single positive or preferably, the amplificates or fragments of the amplificates are catected by matrix assisted laser description/ionization mass spectrometer. Preferably, the amplificates or fragments of the amplificates are detected by matrix assisted laser description/ionization mass spectrometry (MALDI) or using electron spray mass spectrometry (ESI). The present cate containing a methylated cytosine from one of the chemically pre-treated reference DNA samples of the invention. Note: The sequence data for this patent did not form part diversity from with a particular containing a methylatical distriction in the mass spectrometry containing a methylatical containi directly from WIPO at ftp.wipo.int/pub/published pct sequences Sequence 18 BP; 3 A; 0 C; 9 G; 6 T; 0 U; 0 Other;

Oligonucleotide for diagnosing and treating tumors and cancer especially gliomas, astrocytomas and oligodendromas, comprises chemically modified genomic sequences of genes associated with tumors and cancers.

Example 4; Page 23; 31pp; English.

least 18 bases of a segment of chemically pretreated genomic DNA (II) according to one of the sequences (S1) selected from 120 sequences, and its complementary sequences. Also included are an oligomer (III), especially an oligomucleotide or peptide nucleic acid (PNA)-oligomer, comprising a sequence of at least 9 nucleotides which hybridises to or is identical to (II), and complementary sequences, a set of oligomers (IV) The invention relates to a nucleic acid (I) comprising a sequence of

```
·;
comprising at least two (III) and their use for detecting the cytosine methylation state and/or single nucleotide polymorphisms (SNPs) in (II), and manufacturing (MI) an arrangement of different oligomers (array) fixed to a carrier material for analysing diseases associated with the methylation state of the CpG dinucleotide of (SI), where at least one oligomer is coupled to solid phase. The set of oligomers (IV) are useful as primer oligomicleotides for the amplification of (II) especially for characterising classifying and differentiating oligodendroglioma, astrocytoma and oligoastrocytoma tumours (by ascertaining genetic and/or apprenenters of genomic DNA by analysing cytosine methylation and single nucleotide polymorphisms). The present sequence is a PCR primer used to amplify the modified genomic sequence from a gene

                                                                                                                                                                                                                                                  The invention relates to antisense compounds, compositions and methods for modulating the expression of human steroid receptor coactivator-1 (SRC-1). The compositions comprise antisense oligonucleotides targetted to nucleic acids encoding SRC-1 in human cells or tissues. It is also useful for treating a human having a disease or condition associated with SRC-1, by inhibiting expression of SRC-1 in It is also useful for diagnostics, therapeutics, prophylaxis and as research reagents and kits. It is also used in antisense therapy. The present sequence is an antisense oligonuclectick to human SRC-1 DNA. This sequence is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Haematopoietic cell proliferation disorder related oligonucleotide #1048.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Berlin K, Braun A, Distler J, Guetig D, Howe A, Mueller J; Jolek A, Piepenbrock C, Adorjan P, Grabs G, Lesche R, Leu B; Lewin A, Lippscher E, Maier S, Model F, Mueller V, Otto T, Pelet C; Schwope I, Ziebarth H;

ö The invention relates to a method of determining genetic and/or epigenetic parameters for the classification, differentiation and/or diagnosis of prostate tumours or the predisposition to prostate cancer, by analysing cytosine methylation in a sample of genomic DNA. The method comprises chemically treating unmethylated cytosine bases at the 5-position to uracil or another base, which is dissimilar to cytosine in terms of hybridization behaviour; followed by amplifying at least one fragment of the chemically pre-treated genomic DNA using sets of primer oligomucleotides and a polymerase. The oligomers or probes derived from them are useful for detecting the methylation state of all CpG renal cancer; prostate cancer; cytosine methylation; single nucleotide polymorphism; histological; cytological; ss; primer; dinucleotides and/or single nucleotide polymorphisms (SNPs) in a chemically pre-treated genomic DNA. They are all useful for treating prostate carcinoma. This sequence represents an oligonucleotide used tamplify a gene possibly involved in predisposition to prostate cancer Gaps predisposition to prostate cancer, comprises analyzing cytosine which may contain methylated or unmethylated CpG dinucleotides . 0 0.8%; Score 14.4; DB 1; Length 18; 93.8%; Pred. chemically pretreated genomic DNA using sets of primer oligonucleotides and a polymerase. The method is useful for detecting the cytosine methylation state and/or single nucleotide polymorphisms in genomic DNA, particularly for characterising, classifying and/or differentiating renal particularly for characterising, classifying and/or differentiating renal and prostate cancers. The oligomers are useful as primer oligonucleotides for the amplification of any of the 112 DNA sequences of the invention. The set of oligomer probes is useful for detecting the cytosine methylation state and/or single nucleotide polymorphisms in any of the 112 chemically pretreated genomic DNA sequences. The method is also useful for identifying the tissue of origin of cancer cells. The method allows the classification, differentiation and/or diagnosis of cancer tissues using minute samples which would be inadequate for histological or cytological analysis. The present sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                              ö

The sequences given in ABQ80440-45 are primers and probes which were used to determine PEPCK (phosphoenolpyruvate carboxykinase) and SHP (short heterodimer partner) expression in Zucker diabetic fatty (ZDF) fa/fa rats treated with insulin. The composition of the invention for alteration of gluconeogenesis or glucose production comprises an agent which modulates SHP expression or activity. The composition is used for altering gluconeogenesis or production of glucose useful for treating

Kit for determining haplotype of chum salmon, has substrate with immobilized oligonucleotides that detect polymorphisms in mitochondrial DNA control region of chum salmon, by hybridization with chum salmon nucleic acid.

Disclosure; SEQ ID NO 67; 44pp; English.

The present invention relates to a kit for determining haplotype of Oncorhynchus keta, comprising oligonucleotide-immobilized substrate obtained by immobilizing, on substrate, one or more kinds of oligonucleotides that enable detection of polymorphism in a nucleotide sequence of mitochondrial DNA control region of chum salmon, by hybridization, and determining haplotype based on polymorphism or combination of polymorphisms. The oligonucleotides are useful for determining a haplotype of chum salmon by hybridizing a nucleic acid derived from the chum salmon with each oligonucleotide contained in the kit, detecting the presence or absence of formation of a hybrid of each oligonucleotide and the nucleic acid derived from the chum salmon and identifying a polymorphism in the nucleotide sequence of the chum salmon mit cohondrial DNA control region. The present sequence represents a primer of the invention.

autoimmune, degenerative nervous system and infectious disease, comprises nucleic acid primers specifically priming and allowing amplification of a Kit for diagnozing and treating T-cell associated diseases e.g. Wheta gene.

WPI; 2004-059052/06.

Rowen L;

Hood LE,

Disclosure; SEQ ID NO 921; 164pp; English.

The invention relates to a kit for diagnosing and treating T-cell associated diseases which comprises a panel of nucleic acid primers specifically priming and allowing amplification of each Vbeta gene, betaRNA or CDNA. The kit is useful for diagnosing organ transplant rejection and diagnosing and treating T-cell associated diseases. The coluding autoimmune disease, hypersensitivity diseases, infectious diseases, and neoplastic diseases. Autoimmune diseases include Addison's disease, atrophic gastritis. Degenerative nervous system diseases include multiple scheous and Alzheiner's disease. Hypersensitivity diseases include Type atrophic gastrities such as contact with allergens that lead to allergies, Type II hypersensitivities such as those present in Goodpasture's syndrome and Type IV hypersensitivities and as those caused by viruses such as HIV, fungal infections such as those caused by the yeast genus Candida, parasitic infections such as those caused by

                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention describes a molecule (M) for labelling a target material, comprising a conjugate of a transition metal compound with a detectable group, the conjugate having the general structural Formula (I), its tautomers, salts, and acids. (M) is useful for detecting a target material, for imparting a detectable property to a target material, for monitoring a binding process, for monitoring a reaction, for isolating a target material of interest, and for detecting one or more molecules that include a target sequence. The two transition metal chelates are useful for labelling, detecting, and analysing target materials containing oligohistidine target. (M) binds with high affinity and specificity to oligohistidine target sequences, particularly hexahistidine target sequence encodes an oligohistidine suitable as a target
schistosomes, filaria and bacterial infections such as those caused by Mycobacterium. Neoplastic diseases include lymphoproliferative diseases such as leukaemias, lymphomas and cancers such as cancer of the brain, breast. The present sequence represents a Vbeta gene repeat sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Molecule useful for labeling target material, for detecting target material and for imparting detectable properties to target material, comprises conjugate of transition metal compound with detectable group.
                                                                                                                                                                                                                                                                                                                                                                                                                                                       "Labeling molecule associated oligohistidine

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes a method for constructing a synthetic polynucleotide from which a polypeptide is producible to confer a selected phenotype to an organism of interest or part in a different quality than that conferred by a parent polynucleotide that encodes the same polypeptide. The method comprises: (a) selecting a first codon of the parent polynucleotide for replacement with a synonymous codon, where the synonymous codon is selected on the basis that it exhibits a different phenotypic preference than the first codon in a comparison of phenotypic preference than the first codon in a comparison of phenotypic preference than the first where the test organism are selected from organisms of parts, where the corganism of interest and organisms that are related to the organisms of interest, and (b) replacing the first codon with the synonymous codon to construct the synthetic polynucleotide. Also described: (1) a method for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        determining the phenotypic preference of a first codon in an organism of interest or its parts; (2) a synthetic polynucleotide constructed from the method above; (3) an organism or interest or part containing a synthetic polynucleotide constructed from the method above; (4) an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Constructing synthetic polynucleotide for modulating the guality of a selected phenotype displayed by an organism comprises replacing a first codon with a synonymous codon to construct the synthetic polynucleotide.
                                                                                                                                                                    Gaps

encodes the polypeptide; (6) a method of enhancing the quality of a selected phenotype that is displayed by an organism of interest or part and that results from the expression of a parent polynucleotide that encodes the polypeptide; and (7) a method of reducing the quality of a selected phenotype that is displayed by an organism of interest or part and that results from the expression of a parent polynucleotide that encodes the polypeptide. The method is useful for constructing a synthetic polynucleotide from which a polypeptide is producible to confer a selected phenotype to an organism of interest or part in a different quality than that conferred by a parent polynucleotide that encodes the same polypeptide. It is useful for modulating the quality of a selected same polypeptide is no organism or part. The present sequence encodes a synthetic leader sequence, which is used in an example from the present
                                                                                                                                                                                                                                                                                                                                                                                                                                 invention.

Constructing synthetic polynucleotide for modulating the quality of a selected phenotype displayed by an organism comprises replacing a first codon with a synonymous codon to construct the synthetic polynucleotide. Example 1; SEQ ID NO 87; 86pp; English. The present invention describes a method for constructing a synthetic polynucleotide from which a polypeptide is producible to confer a selected phenotype to an organism of interest or part in a different quality than that conferred by a parent polynucleotide that encodes the same polypeptide. The method comprises: (a) selecting a first codon of the parent polynucleotide for replacement with a synonymous codon, where the parent polynucleotide for replacement with a synonymous codon, where the synonymous codon is selected on the basis that it exhibits a different phenotypic preference than the first codon in a comparison of phenotypic preference than the first codon in a comparison of phenotypic preferences in test organisms or parts, where the test organism are selected from organisms of the same species as the organism of interest and organisms that are related to the organisms of interest; and (b) replacing the first codon with the synonymous codon to construct

the synthetic polynucleotide. Also described: (1) a method for determining the phenotypic preference of a first codon in an organism of interest or its parts; (2) a synthetic polynucleotide constructed from the method above; (3) an organism or interest or part containing a synthetic polynucleotide construct that comprises a regulatory polynucleotide operably linked to a tandem repeat comprises a regulatory polynucleotide operably linked to a tandem repeat of a first codon tused in frame with a reporter polynucleotide operably linked to a tandem repeat of a first codon tused in frame with a reporter polynucleotide that encodes a reporter protein, which produces, or is predicted to produce a selected phenotype in the organism or part; (5) a method of modulating the quality of a selected phenotype that is displayed by an organism of interest or part encodes the polypeptide; (6) a method of enhancing the quality of a cencodes the polypeptide; (6) a method of enhancing the quality of a cencodes the polypeptide; (6) a method of reducing the quality of a cencodes the polypeptide; (7) a method of reducing the quality of a cencodes the polypeptide; (7) a method of reducing the quality of a cencodes the polypeptide. The method is useful for constructing a conferted phenotype that is displayed by an organism of interest or part or part or selected phenotype to an organism of interest or part in a different organism to organism of interest or part in a different conferted phenotype to an organism of interest or part in a different conferted phenotype to an organism of interest or part in a different conferted phenotype ting useful for modulating the quality of a selected phenotype displayed by an arent polymucleotide that encodes the polypeptide. It is useful for modulating the quality of a selected phenotype displayed by an organism or part. The present sequence encodes the polypeptide is producing the present encodes the polypeptide.

synthetic polynucleotide for modulating the quality of a P-PSDB; ADO26659 Constructing

selected phenotype displayed by an organism comprises replacing a first codon with a synonymous codon to construct the synthetic polynucleotide.

Example 1; SEQ ID NO 51; 86pp; English.

The present invention describes a method for constructing a synthetic polymucleotide from which a polypeptide is producible to confer a selected phenotype to an organism of interest in a different gality than that conferred by a parent polymucleotide that encodes the gality than that conferred by a parent polymucleotide. The method comprises: (3) selecting a first codon of the parent polymuclacetide. The method comprises: (3) selecting a first codon of the parent polymuclacetide for replacement with a synonymous codon of the parent polymuclacetide for method comprises: (4) selected on the basis that it exhibits a different phenotypic preference than the first codon in a comparison of phenotypic preference than the first codon in a comparison of conginism are selected from organisms of the same species as the organism of interest and organisms that are related to the Organisms of interest of interest and organisms that are related to the Organism of interest of interest or its parts; (2) a synthetic polymucleotide constructed from the method above; (3) an organism or interest or part containing a synthetic construct that comparises a regulatory polymucleotide operatory polymucle

This 3'-PCR primer is used in a novel method for identification of allele types (in this case human leukocyte antigen (HLA) class II gene alleles) of a known polymorphic genetic locus in a sample. The allele type is identified by first combining the sample with a sequencing reaction mixture containing a polymerase, nucleoside feed stocks, one type of chain terminating nucleoside and a sequencing primer under conditions suitable for template dependent primer extension to form a number of oligonucleotide fragments of differing lengths, which are then evaluated on a denaturing gel. This determines the position of the type of base corresponding to the chain terminating bases in the primer. However, this method differs from standard sequencing procedures, instead of performing and evaluating four concurrent reactions, the sample is concurrently combined with at most three sequencing reaction mixtures containing different types of chain terminating nucleosides. The method can be used for the evaluation of polymorphic sites, and for determining the allelic type of a polymorphic sites, and for determining the allelic type of a polymorphic sites, and for determining the allelic Identification of allele type of a known polymorphic genetic locus - used particularly for human leukocyte antigen allele determination. The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or call-cycle dependent kinases CDK1, PCNA, and Cyclin B1.

Representative examples of ribozyme recognition sites are given in AAA86415 to AAA86787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient in ribozyme is resistant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel decorin binding proteins, DBP A and B useful as vaccines for protecting humans against Lyme disease and as immunogens for production of antibodies used in passive immunotherapy, or as diagnostic reagents.
                                                                                                                                                                                                    New hairpin and hammerhead ribozyme for inhibiting restenosis, cleaves RNA encoding a cyclin or cell-cycle dependent kinase other than CDKI, PCNA and Cyclin B1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Decorin binding protein; DbpB; DbpB; adhesin; infection; Lyme disease; spirochete infection; vaccine; passive immunotherapy; PCR primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence was used in the development of a novel method for classifying patients suffering from an inflammatory disease. The method comprises identifying in DNA from at least 1 patient a sequence polymorphism, as compared with the normal 5-lipoxygenase (5-LOX) gene (AAT88431), in a 5-LOX regulatory gene sequence. The method can be applied to subjects with asthma, ulcerative colitis, bronchitis, sinusitis, psoriasis, allergic and non-allergic rhinkis, lupus or rheumatoid arthritis. Specifically it can be used to diagnose asthma or susceptibility to disease, identify treatments suitable for individual patients or assess the likely success of treatment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Ribozyme; hairpin; hammerhead; gene therapy; vasotropic; restenosis; ss.

The preparation of a phosphitylated compound comprises a activators. The preparation of a phosphitylated phosphitylating reagent in the presence of a pyridinium salt in a solvent. The phosphoramidites are useful as building blocks for synthesis of oligonucleotides, which are potentially useful in therapeutic and diagnostic applications. The activators can be produced in situ by mixing pyridine and an acid, producing benefits in large scale synthesis. Compared with conventional activators, e.g. 1H tetrazole, the pyridinium salts, and materials necessary for their generation in situ, are nonsciporative and easier to store, and also cheaper and have higher solubility in organic solvents. Final purity of the phosphitylated material results from use of a less acidic reaction medium when pyridinium salts are used. The present sequence represents a
DbpA and DbpB. DbpA and DbpB are adhesins, and are immunogenic. DbpA is a target for antibody-mediated killing of B. burgdorferi during the early stages of infection. The polypeptides are useful for producing antibodies to diagnose Lyme disease (spirochete infections), or for producing vaccines for prophylaxis and/or treatment of such infections. The antibodies may be useful in passive inmuchterapy, as diagnostic reagents and as reagents in other processes such as affinity chromatography
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Phosphorothioate; activator; oligonucleotide synthesis; phosphoramidite;

The specification describes a method for increasing or reducing osteoblast proliferation or differentiation. The method comprises administering an oestrogen related receptor alpha (ERRalpha) agonist antagonist, a purified ERRalpha or antibody, a nucleotide sequence encoding ERRalpha, an ERRalpha antisense sequence, or an ERRalpha modulator. The method is useful for increasing or reducing osteoblast proliferation or differentiation in a mammal. The method may be used for treating a disorder associated with bone loss, such as osteoporosis, osteoarthritis, Paget's disease, periodontal disease, osteolytic bone tumour metastases in e.g. breast cancer and multiple mysteomy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Modulating osteoblast proliferation or differentiation for treating bone diseases, e.g. osteoporosis, bone tumor, comprises administering an estrogen related receptor (ERR) alpha agonist, antagonist, antibody or

The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme [1] which claeves RNA encoding a cytckine involved in inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule [II] comprising a promoter operably linked to a nucleic acid segment encoding [1]. [1] can have antipsoriatic, antisickling, chratchel and cytostatic, antiseborrheic, antidiabetic, antisickling, chratchel and cytostatic, antiseborrheic, antidiabetic, antisickling, chratchel and virucide activities, and cleaves RNA encoding Cytokine involved in inflammation. [1] can be used in gene therapy. [1] and [II] are useful for treating proliferative skin diseases such as psoriasis, atopic dermatitis, actinic keratosis, squamous or basal cell cartinoma and viral or seborrheic wart. They can also be used for treating proliferative eye diseases such as diabetic retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detachment, and for treating and preventing scarring such as keloid, adhesion and hypertrophic or hypertrophic burn scar. AAHS7577 to AAHG2099 represent sequences used in the care and invention

Also described: (1) kits for in vitro or in vivo delivery of siNA; (2) conjugates and/or complexes of siNA; and (3) vectors that express BiNA. The siNAs have vasotropic, nootropic, antiparkinsonian, neuroprotective, cytostatic, antiinflammatory, antiallergic, virucide, anti-HIV, immunosuppressive, anticonvulsant and nephrotropic activities, and can be used in gene therapy, and for the modulation (inhibition) of expression or activity of NF-kappaB by RNA interference (siNA target mRNA, RNA splice variants, post-

Beigelman L; WPI; 2003-689788/65. Mcswiggen J,

The present invention describes a short interfering nucleic acid (siNA) that downregulates expression of a nuclear factor kappa B (NF-kappaB) can by RNA interference. Also described: (1) Kits for in vitro or in vivo delivery of siNA; (2) conjugates and/or complexes of siNA; and (3) vectors that express siNA. The siNAs have vasotropic, nootropic, antiparkinsonian, neuroprotective, cytostatic, antiinflammatory, antialergic, virucide, anti-HIV, immunosuppressive, anticonvulsant and nephrotropic activities, and can be used in gene therapy, and for the modulation (inhibition) of expression or activity of NF-kappaB by RNA interference (siNA target mRNA, RNA splice variants, post-transcriptionally modified RNA, pre-RNA and/or RNA templates). The siNA sequences can be used to modulate expression of NF-kappaB genes, in grafts and transplants for treating restenosis and central nervous system cars, other proliferative diseases (restenosis and central nervous system cancers, other proliferative diseases (restenosis and polycystic kidney disease), inflammatory and/or allergic diseases, viral infections (including HIV), autoimmune diseases (restenosis and polycystic kidney disease), inflammatory and/or allergic diseases, viral infections of for drug screening; disagnosis; target identification and validation; genetic engineering; pharmacogenomics; studying gene function and gene represents human v-rel reticuloendotheliosis viral concogene homologue A (REL-A) sinA, which is used in the exemplification of the present invention. REL-A is a nuclear factor of the kappa light polypeptide gene ö short interfering nucleic acid; siNA; protein tyrosine phosphatase type IV; PRL3; RNA interference; cytostatic; New short interfering nucleic acid downregulates expression of the NF-kappaB gene useful e.g. for treatment and diagnosis of cancer and Gaps Protein tyrosine phosphatase type IV (PRL3) gene siNA, SEQ ID No 99. . 0.8%; Score 14.4; DB 1; Length 19; 93.8%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                               The invention relates to a novel short interfering nucleic acid (siNA) that downregulates expression of a protein tyrosine phosphatase type IV (FRL3) gene by RNA interference. The invention further relates to modulating the expression of PRL3 genes in cells, tissue explants or organisms by the introduction of an siNA, kits for in vitro or in vivo delivery of an siNA, conjugates and/or complexes of siNA, and vectors that express siNA. The novel siNA so of the invention have cytostatic activity. SiNA's are used to modulate expression of PRL3 genes, in cells, tissue explants or organisms, e.g. for treating cancer but also for drug soreening; pharmacogenomics; studying gene function and gene mapping (e.g. of single-nucleotide polymorphisms). This polymucleotide sequence represents a short interfering nucleic acid for downregulating the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     short interfering nucleic acid, siNA; protein tyrosine phosphatase type IV; PRL3; RNA interference; cytostatic;

```
that downregulates expression of a protein tyrosine phospharase type IV PRL3) gene by RNA interference. The invention further relates to modulating the expression of PRL3 genes in cells, tissue explants or organisms by the introduction of an isNA; kits for in vitro or in vivo delivery of an siNA; conjugates and/or complexes of siNA; and vectors that express siNA. The novel siNA's of the invention have cytostatic activity. SiNA's are used to modulate expression of PRL3 genes, in cells, tissue explants or organisms, e.g. for treating cancer but also for drug screening; diagnosis; target identification and validation; genetic engineering; pharmacogenomics; studying gene function and gene mapping (e.g. of single-nucleotide polymorphisms). This polynucleotide sequence represents a short interfering nucleic acid for downregulating the expression of a protein tyrosine phosphatase type IV (PRL3) gene of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Screening method for agonists or antagonists to alter binding properties of novel G protein-coupled receptor protein in controlling cholesterol metabolism, used to diagnose and treat inflammatory diseases or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Screening, G protein-coupled receptor; cholesterol metabolism; ss; inflammatory disease; transplantation rejection; immune insufficiency; infection; PCR; primer; TNF alpha.
                                                                                                                                                                                                                                                  The invention relates to a novel short interfering nucleic acid (siNA)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
New short interfering nucleic acid, useful e.g. for treatment and diagnosis of cancer , downregulates expression of a protein tyrosine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   0.8%; Score 14.4; DB 1; Length 19;

                                              The invention comprises a method for screening for compounds that are receptor protein. The method of the invention is useful for screening agonists or antagonists to alter binding properties of novel G protein-coupled receptor proteins in controlling cholesterol metabolism. The method of the invention is useful in the diagnosis and treatment of inflammatory diseases, excessive immune reaction after transplantation, immune insufficiency and infections. The present DNA sequence represents
                                                                                                                                                                                                                                                                                                                                                                                                                                                       cytostatic; vasotropic; nephrotropic; cerebroprotective; treating leukaemia; solid tumors; restenosis; polycystic kidney disease; bronchiolitis; glomerulonephritis; stroke; RNA interference; short interference; short interfering RNA; sink, double-stranded RNA; micro-RNA; miRNA; short hairpin RNA; siRNA; double-stranded RNA; micro-RNA; miRNA; short hairpin RNA; shRNA; therapeutic target identification; pharmacogenomics; gene function analysis; gene mapping; human; platelet derived growth factor receptor; PDGFr; ss.

CC The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the human platelet-derived growth factor ceresptor (PDGFT) gene by RNA interference. The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonucleotide and an antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA, doublect stranded RNA, micro-RNA (miRNA) and short hairpin RNA (siRNA, doublect stranded RNA, micro-RNA (miRNA) and short hairpin RNA (siRNA). The siNAs can be unmodified or chemically modified, can contain covertor or enzymatically synthesised, expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siRNA; conjugates and/or complexes of siRNA; and vectors that express siNA, The siNAs are used to modulate expression of the PDGFT gene in cells, tissue explants or coganisms (e.g., by ex vivo gene therapy), or in grafts and transplants or since the treatment of a variety of conditions. They may be used for treating leukaemia and solid tumours, restenosis, polycystic kidney disease, bronchiolitis, glowmenlonephritis and stroke. The siNAs are also useful for drug screening, diagnosis, therapeutic target identification of and vabladation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single mucleotide polymorphisms).

The present sequence represents the upper strand of a human PDGFrest expression the present sequence represents the upper strand of a human poger.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

treating leukamia and solid tumours, restenosis, polycystic kidney disease, bronchiolitis, glomerulonephritis and stroke. The siMs are also useful for drug screening, diagnosis, therapeutic target identification and validation, genetic engineering, pharmacogenomics, studying gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the lower strand of a human PDGFr targeted double-stranded siNA, which is identical to the PDGFr transcript
                                                                                                                                                                                                                                                                                                                                                                                                               decorribonuclectides, and can be chemically synthesised, expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siRNA; conjugates and/or complexes of siRNA; and vectors that express siNA. The siNAs are used to modulate expression of the PDGFr gene in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be used for
                                                                                                                                                                                                                                                                  receptor (PDGFr) gene by RNA interference. The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonucleotide and an antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA, doublestranded RNA, micro-RNA (miRNA) and short hairpin RNA (shRNA). The siNAs can be unmodified or chemically modified, can contain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               antidiabetic; anorectic; anabolic; eating-disorder; immunosuppressive;

The invention relates to screening agonist or antagonist of receptor protein or glucagon-like peptide-1 (GLP-1) secretagogue or GLP-1 secretion inhibitor, by using 6 protein coupled receptor 7GR5. The 7GR5 is derived from human, mouse, rat, cow, rabbit or guinea pig. The compound is an inhibitor of cytokine production. The compound is a GLP-1 secretion promoter. The agonist of GPCR secretion promoter, pancreas regenerating agent, pancreatic beta-differentiation or growth promoter. The agonist of GPCR is useful for producing a GLP-1 secretion promoter, prophylactic and/or therapeutic agent of diabetes, insulin hyposecretion, pancreatic exhaustion, obesity, anorexia or regeneration of pancreas. The antagonist of GPCR having is useful for producing GLP-1 secretion inhibitor and prophylactic and/or therapeutic agent of hypoglycaemia. TGR containing the compound is useful as prophylactic or therapeutic agent of pathological conditions associated with regulation of physiological conditions associated with regulation of physiological immunosuppressive agent for suppressing immune reaction after cardiac facilure, myocardial infarction, acute renal failure, angina, arrhythmia, bronchia asthma, chronic obstructive pulmonary disease, atterioaclerosis, rheumatoid arthritis, diabetes, gastric ulcer, ulcerative colitis, allergy, osteoarthritis, laubus erythematosus, infectious disease or after transplant. Sequences ADP67047-ADP67061 crepresent PCR primers and probes specific for interleukin (IL)-1 alpha, used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Rat; matrix metalloproteinase 11; MMP11; ss; antisense oligonucleotide; phosphorothioate linkage; 2'-O-methoxyethyl sugar moiety; 5-methylcytosine; hyperproliferative disorder; cancer; cytostatic; probe.
                                                                                                                        Screening agonist or antagonist of receptor protein or glucagon like peptide-1 secretion inhibitor, by using G protein coupled receptor and compound capable of altering binding property of cholesterol metabolism
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

                                                                                                                                                                                                                      The invention relates to a compound targeted to a nucleic acid molecule encoding a matrix metalloproteinsse 11 (MMP11) polypeptide. The compound is an antisense oligonucleotide that specifically hybridises with the nucleic acid and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar moiety, preferably a 2'-O-methoxyethyl agar moiety, or at least one modified nucleobase comprising a 5-methylytrosine. The antisense compounds are useful for modulating the expression of the MMP11 polypeptide and in preparation of a composition for treating hyperproliferative disorders, e.g. cancer. This sequence repersents a probe which hybridises to DNA encoding the rat MMP11 polypeptide of the invention.
                                                                                                              New oligonucleotide compound that inhibits expression of matrix metalloproteinase 11, useful for preparing a composition for treating hyperproliferative disorder, e.g., cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Oligo-nucleotide for detecting microbe with high sensitivity and selectivity - more specifically for targetting a nucleotide sequence coding a thermostable direct haemolysin-related haemolysin gene type
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Vibrio parahaemolyticus; thermostable direct; haemolysin-related; haemolysin gene; type 2; type 1; V.p; polymerase chain reaction; PCR; primer; detection; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Labelled primers-a and -b (AAQ42490 and AAQ42491, respectively) were used to amplify sample DNA from Vibrio parahaemolyticus WP1. Primer-a is specific to the tdh gene. A third oligonucleotide (AAQ42492) was added to the denatured PCR product, allowed to anneal and the annealed product was added to a solid substrate. The target sequence was detected by measuring absorbance at 492nm, without the need for electrophoresis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Detection of nucleic acid - involves amplifying using DNA synthetase and labelled oligo:nucleotide, modifying etc. avoiding electrophoresis.
direct hemolysin-related hemolysin gene type 1 and type 2. These sequences can also be used to detect V.p by acting as polymerase chain reaction primers. These oligos allow highly sensitive detection of V.p
                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
